

H13 round 1: model families carry a stable, style-borne content field; couplings follow rooms, not families

| Prediction                                           | Observed                                                                               | Verdict              |
|------------------------------------------------------|----------------------------------------------------------------------------------------|----------------------|
| P1 family field beyond the day field                 | $p < .05$ in 9/15 (needed 10); RE $T = 0.080$ [0.024, 0.137]                           | mixed                |
| P2 field survives style residualization              | 0/9; RE $T = -0.001$ [-0.037, 0.035]                                                   | FALSIFIED            |
| P3 family field invariant; agent field not           | family median cos 0.88 vs regroup null 0.76 ( $p = 0.008$ ); agent 0.81                | family ✓ / agent ✗   |
| P4 period-specific family part (S-b)                 | $T'$ $p < .05$ in 3/14 (needed $\geq 1/3$ )                                            | failed               |
| P5 no family homophily in talk timing                | one-room n.s. 4/5; two-room $b_{\text{lab}}$ n.s. 10/10; RE $\Delta = 0.002$           | supported            |
| P6 content co-movement not family-structured         | $\Delta$ $p < .05$ in 1/15; RE $\Delta = -0.002$ [-0.019, 0.015]                       | supported            |
| P7 room dominates coupling; family persists in field | y1 room>lab 8/10; y3 room>lab 9/10; y2 $b_{\text{lab}}$ $p < .05$ 7/10 (but S-a: 0/10) | supported (y4 mixed) |
| P8 lexical + unfitted classification                 | 'genuinely' 3/15; LOO 7/15; newcomers 36% vs chance 14% ( $p = 0.06$ )                 | failed               |
