

H28 round 1: are links the contagion vector of herding?

P1 ($\kappa > 0$, $p < .05$, $z_{\text{shift}} \geq 2$): supported 3, weak 7, failed 1 of 11 tested herding periods; pooled $\kappa + 0.83 \pm 0.12$ ($e^{\kappa} 2.30$).
Median λ 0.036 extra arrivals per link exposure; median R_{link} 0.18; removing all links: median simulated peak occupancy $\times 0.79$.

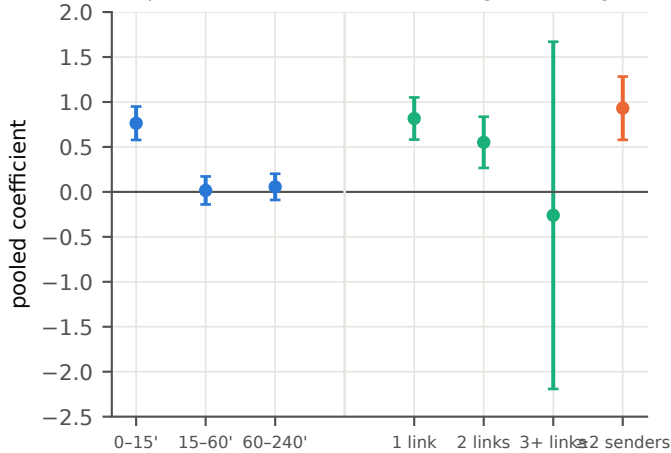

(a) per-period $\hat{\kappa}$ (gray: shift null ± 2 sd)

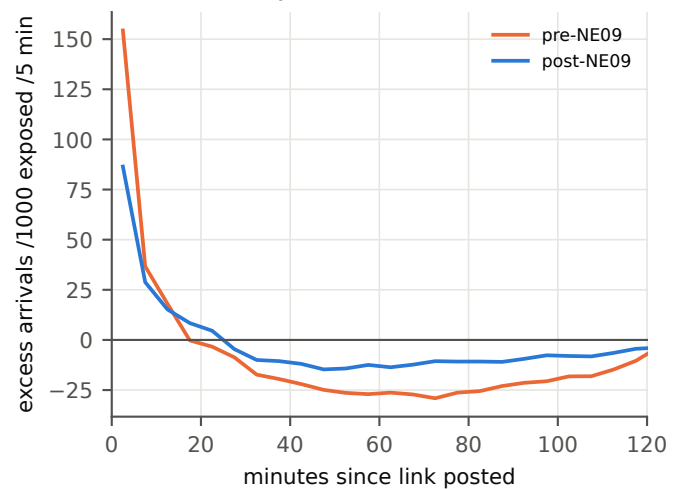

(b) lead placebo: future links predict as well

(c) pooled kernel (blue) and dose (green/orange)

(d) NE09 latency

(e) counterfactual: simulated peak single-project occupancy under link throttling
