

H20 · Content aging in the AI Village (exploratory round 1, non-holdout)

No aging. Card verdict mixed (Amendment-2 null; pre-registered null: failed). Random-effects aging slope over 10 long + medium goals: $+0.020 \pm 0.021$ ($I^2 = 0.45$).

Observable: two-time correlation $C(t_w + \tau, t_w)$ of each agent's whitened day state, t_w in active days since the goal's kickoff; aging slope $A = \partial C / \partial \log t_w$ at fixed lag ($t_w \geq 2$), tested against a fitted stationary swarm model (parametric bootstrap). Synthetic (village sampling): size 0.03-0.07; power 0.33-0.44 vs $\mu = 0.5$ aging, 0.65-0.88 vs $\mu = 1$ (long goals). Real data: the isotropic null was anti-conservative (robust z-SD 2.07); content fluctuates in ~5-12 dimensions, not 32. Amendment 2 (estimated latent shapes) restores calibration (robust z-SD 1.07). #38: strong positive A, but front-loaded: lag-1 C rises 0.66 → 0.87 over 4 days, then flat (kickoff relaxation, not aging). #51: $\mu = 0.5$ aging rejected; a weak late slowing ($\hat{\mu}$ 0.22) in the intention stream only. #4, #8: nothing. Short goals: holiday days (Thanksgiving, Christmas) and phased weeks dominate; no age effect. Holdout not run.
