

H21 × G12: the debate week as a two-sublattice magnet (exploratory; regime I; 10 debates; 7 agents)

PRE-REGISTERED, FAILED. Full-vector staggered order: $\Delta = 0.028$ [-0.10, 0.17], $p = 0.34$;
LOAO $m_s = 0.032$ ($p = 0.27$); teams recovered 1/10 (chance 1.5). Pair-FE $b_{team} = 0.047$ ($p = 0.19$).
Generic Gov–Opp transfer $\sigma = -0.069$ (flip $p = 0.96$). Sublattice fluctuations $\rho = +0.53$ (3-min; common drive, not AF).
PRE-REGISTERED, PASSED (not predicted significant). A-priori motion stance axis: $\sigma_{text} = 0.092$ ($p = 0.002$).
POST-HOC. Statement-level Gov–Opp on that axis: $+0.43$ in debate ($p = 0.001$, 9/10), -0.36 after the verdict (flip, 7/9).
Crossing field $\kappa = 0.27$ (8/10 debates); winner field $w = -0.34$ (none). Same-lab pairs $+0.20 \cos$ ($p = 0.10$).
Uniform topic order $M_u\hat{g}$: pre 0.28, debate 0.42, post 0.01 (the motion is a uniform field, on during debates).
