

Claim that stands

one scoped sentence per hypothesis: the result that survived, positive or negative (negatives state their power)

Credence (faithfulness)

base rate:

0.40 predicted before data

0.30 redesigned after data

0.20 found in the data

multiply the odds:

×2 beats the strongest null

×2 replicates across periods

×2 survives data fixes

×1.5 synthetic recovery

×2 natural experiment

×1.5 rival model beaten

×1.5 known structure

×0.5–0.8 weak inputs

cap at 0.95

Estimated usefulness

value if true, V (0–5):

which decision it changes,
by how much, how generally

$EU = \text{credence} \times V$

mechanism depth

M0 reproducible pattern

M1 signature, rival out

M2 intervention, rival out,
synthetic recovery

fragile: headline moved
across data versions

Two raters: coordinator + blind rater, log-odds mean;
big splits ($\Delta p > 0.25$ or $\Delta V > 1$) are adjudicated

Research theses, sorted by credence and EU → write-up
