

H145: Ideology egregores in #51: memplexes that live above their hosts and are Krakauer individuals at the pattern level

Vivian Rogers, with Claude Opus 5.5 · agent-swarm physics · Updated 2026-10-09

Complete 55% Faithfulness 1/5 Usefulness 1/5

Bottom line. Memplexes exist in #51 beyond chance; at most one is a pattern-level individual, and it may be a leaked field.

level: hypothesis · pipeline checks 86% · updated 2026-10-09

WHAT HAPPENED

An *ideology egregore* is a memplex: a set of content elements that many agents express together, whose hosts change while the pattern persists, and whose own state predicts its next state beyond the fields that act on the agents. H145 discovers memplexes in #51 (45 non-reserved days, 32 agents, 8 labs) from 2,011 elements: meaning clusters, coined names and rare words, cleaned shared repos and touched projects. It then tests host renewal and Krakauer colonial individuality at the pattern level. **Result:** 15 cross-lab memplexes exist beyond chance timing. Two or three renew their hosts. One broad topic community (K03) carries 0.20 bits per 2-h transition beyond the coded fields. The field control is uninformative, so K03 may still be a leaked field.

Observables. Real #51 memplexes. Left: host renewal $D_K(5)$ minus the 95th percentile of 200 frequency- and host-count-matched pseudo-patterns; three pass (green; K14 on a degenerate null). Right: colonial A excess z at 2 h with E held; only K03 passes among the renewal patterns. Role-text field patterns R0–R5 (not shown) have $A^* z \leq 1.0$ and $A z \leq 1.4$.

SO WHAT? PRACTICAL VALUE FOR UNDERSTANDING AGENT SWARMS

PHYSICAL MODEL

Models 12 (information dynamics) and 13 (conventions). Element expression $x_{i,e}(b) \in \{0,1\}$; hosts $H_K(b) = \{i : \sum_{e \in K} x_{i,e}(b) \geq 2\}$; state $S_K(b) = \text{host level} \times \text{which third of } K \text{ dominates}$ (13 symbols). Discovery: positive PMI of co-expression beyond each agent's vocabulary and each agent-bin's activity (A1), Benjamini–Hochberg edges, Louvain $\gamma = 1$. E : scheduler phase, exogenous messages and their similarity to K , role-text field, rest-of-village activity, lagged one bin.

$$E_{ef} = \sum_i w_i c_{ie} c_{if}, \quad w_i = \frac{\sum_b a_{ib}^2}{(\sum_b a_{ib})^2}$$

$$A_K = I(S'_K; S_K | E) = L(S'_K | E) - L(S'_K | S_K, E)$$

$$A_K^* = I(S'_K; S_K)$$

$$D_K(5) = S_K(5) - S_H(5)$$

For an operator: the village's shared vocabulary organizes into about 15 large cross-lab topic communities, each carried by 15–31 agents on almost every day. Most are carried by the same agents day after day. Their next state is predictable from the schedule, operator input and role texts, not from the pattern itself. One broad engagement-and-papers community (K03) adds 0.20 bits per 2-h step beyond those inputs, in the second half of the period only. Do not treat the named norms (verification, consent, onboarding) as self-sustaining ideologies on this evidence.

RESULTS VS PREDICTIONS

prediction	observed	verdict
P1 ≥ 3 meme-plexes	15 vs null 95th pct 6	supported
P2 as written	power 0.20 in synthetic	untestable
P2 renewal (A4)	3/15 (margins 0.03–0.04)	supp. (fragile)
P3 with Δ	Δ power ≤ 0.10	untestable
P3a colonial (A5)	A K03: 0.20 [0.07, 0.33] bits, z 2.96	supp. (fragile)
P4 field controls	no A^* ($z \leq 1.0$)	failed
P5 story labels	verify, onboarding not in P2 set	failed
P6 peak at 1 day	K03, K07 peak at 30 min	failed

G51 $\sim$ mixed

GOAL PERIODS IN DETAIL

FAITHFULNESS SCORECARD

A mapping	1	F identifiability	1
B assumptions	1	G ground truth	0
C adequacy	1	H comparative	1
D unfitted predictions	1	I transfer	0
E interventional	0		

Level: **hypothesis**. Scale 0 not done or failed, 1 partial, 2 passed (`writeup/paper.tex`).

CAVEATS

Exploration data only; the reserved tail 51m is untouched. The first discovery (old rules, old cleaner) was seen before the amendments. Labels come from a token rule, and the large communities mix several story families. E is coarse (tertiles), and exogenous input falls in 94% of bins. K03's pass is post hoc confined to days 23–45 and to $m \geq 2$, and a rerun of the null gives z 2.67. The 30-min and 1-day tests are not synthetic-validated. Reserved #45–#50 were read for vocabulary by a helper and are not used.

ROUND 2

Build a field control with organismal A^* (operator-topic patterns). Split the large communities so verify, consent and onboarding resolve. Read-gate K03's recruitment (H146) and test its value under wipes (H147). Run the frozen confirm on 51m after sign-off.

- **H145-R1** Field control with A^* .
- **H145-R2** Resolve the story families.
- **H145-R3** Test K03 causally.

H145-ideology-egregores-51 · generated 2026-10-09 13:58 by infra/summaries/build_summaries.py · card hypotheses/H145-ideology-egregores-51/README.md · ratings: H145 agent (suggested) (page 2)

Second figure. Synthetic validation on the real #51 skeleton (20 replicates per world). Left: the card's discovery rules find ~ 24 “memplexes” even with no coupling; the amended rules (A1) find none, and recover every planted one. Right: pass rates of the amended renewal test and of colonial A; size ≤ 0.05 end-to-end for hubs and sticky hosts, 0.20 for a field seen through a noisy E .
