WHAT HAPPENED

Not yet summarized. The question: Which composite of agents and artifacts best predicts its own future (information-theoretic individuality and autonomy), and is it a set of behaviorally coordinated agents together with the artifact they work on? Vivian’s scope (2026-10-04): superagents should be identified by *coordinated behavior*, not by room. Candidate composites come from coordination (behavior-state synchrony, co-adoption, joint work on the same artifact, reply/stance structure), possibly spanning rooms; rooms are only one baseline partition. Builds on H01 round 2 (R4–R8). Starting point from H01 round 2 (2026-10-04): no effective superagent was found among coordination-defined units (crews, synchrony, co-allocation an

PHYSICAL MODEL

From: physics-models/04-semantic-information. The unit is KW’s system X with a categorical allocation state (which artifact), the environment is everything outside $A_G \cup R_G$; individuality and autonomy are Krakauer et al.’s and Bertschinger et al.’s conditional mutual informations estimated as held-out log-loss differences; the group store is the coordination gain g (a transfer entropy from the unit’s allocation to

SO WHAT? PRACTICAL VALUE FOR UNDERSTANDING AGENT SWARMS
