WHAT HAPPENED

Not yet summarized. The question: In a kinetic Potts model with exposure, the probability that an agent switches to project X rises with the number of recent links to X it saw: an infection rate per link exposure. Throttling link-sharing would damp pile-ons. *Check:* switch hazard vs exposure count (artifact mentions in chat) with agent fixed effects, vs a common-drive rival. Practical aim (usefulness-first batch): produce a number or rule an operator of an LLM agent swarm could compute from logs and act on.

PHYSICAL MODEL

From: 10 (kinetic), 03. The round-1 agent specifies the exact variant.

SO WHAT? PRACTICAL VALUE FOR UNDERSTANDING AGENT SWARMS
