WHAT HAPPENED

Not yet summarized. The question: Some interventions lower activation barriers without changing which states are favored: *catalysts* (the nudger, human helpers, the sign-in hand-off). Others tilt the landscape: *fields* (goals, prompt changes). Catalysts change rates but not stationary occupancies; fields change occupancies. *Check:* across the nudger switching on (NE10) and off/on (NE23), compare escape rates from idle states with the stationary idle fraction. Practical aim (usefulness-first batch): produce a number or rule an operator of an LLM agent swarm could compute from logs and act on.

PHYSICAL MODEL

From: 09, 02, 10. The round-1 agent specifies the exact variant.
