level: hypothesis · pipeline checks 14% · updated —

WHAT HAPPENED

Not yet summarized. The question: Does a Gittins-style index computed from an agent’s trap age and time since its last read-out choose whom to nudge better than the logged nudger and than H35’s once-early rule, by more than H35’s $\times 2.3$?

PHYSICAL MODEL

From: physics-models/ιNN-slugι/ ιWhich variant of that model this hypothesis uses, its parameters, and what it predicts here. E.g. ”SIS with spontaneous adoption field ϵ ; λ , γ , ϵ fit per regime.”ι

SO WHAT? PRACTICAL VALUE FOR UNDERSTANDING AGENT SWARMS
