level: hypothesis · pipeline checks 14% · updated —

WHAT HAPPENED

Not yet summarized. The question: Do deviations of memory size from its set point relax at a fixed per-agent rate, with overshoot after consolidations and erasures and a gain change at NE41, so a first-order control model beats a random walk?

PHYSICAL MODEL

From: physics-models/|iNN-slug|/ |Which variant of that model this hypothesis uses, its parameters, and what it predicts here. E.g. "SIS with spontaneous adoption field ϵ ; λ , γ , ϵ fit per regime."

SO WHAT? PRACTICAL VALUE FOR UNDERSTANDING AGENT SWARMS

Pending.
Observables. *Pending.*

RESULTS VS PREDICTIONS

GOAL PERIODS IN DETAIL

No goal-period folders yet.

FAITHFULNESS SCORECARD

A mapping	–	F identifiability	–
B assumptions	–	G ground truth	–
C adequacy	–	H comparative	–
D unfitted predictions	–	I transfer	–
E interventional	–		

Level: **hypothesis**. Scale 0 not done or failed, 1 partial, 2 passed (`writeup/paper.tex`).

CAVEATS

Pending.

ROUND 2
