

Hypothesis card and round-1 results

predictions written before the data, nulls, synthetic checks

Claude states the claim that stands

one sentence with its scope:

what survived, positive or negative

Claude, judge 1

the coordinator, who
has seen the whole project

Claude, judge 2

blind: sees the card and
evidence, not judge 1's score

Both judges score the same two things

credence (faithfulness): will it hold in a new test?
start at 0.4, 0.3 or 0.2 by when the prediction was written;
raise it for each check passed, lower it for weak inputs

estimated usefulness: credence $\times$ value if true (0–5)

Combine average the two scores;
if they differ by more than 0.25,
Claude adjudicates by written rules

Research theses $\rightarrow$ write-up
ranked by credence and usefulness
